

Angular environments using VSCode and Devcontainers

What we want to accomplish

- Unified development environments in all of the team's computers
- Debug from inside such environment

What we need

- VSCode
 - [Dev Containers](#)
- Docker

Useful configuration files [here](#)

Case 1: Containerize and existing Angular application

Setting up configuration files

- Create a `.devcontainer` folder
- A starting point can be found [here](#)
- Or [here](#)
- Command `Remote-container: Open Folder in Container`

Wait for it to build...

Running our app

Setting up Debugging

Setting up for testing (?)

Case 2: Creating an Angular application from the ground-up
